VIABILITY**

CONTENTS

-
- Editorial** **4**
-
- The causation and prevention of bed sores** **6**
Pressure sores are said to be the commonest iatrogenic disease. This paper, first published in *Bedsore Biomechanics* in 1976, discusses the factors that play a significant part in tissue necrosis.
R Roaf
-
- Pressure sores – the problem** **9**
This paper, first published in *Bedsore Biomechanics* in 1976, focuses on the biology and mechanics of the breakdown of normal surface tissues and denervated tissues.
PW Brand
-
- Pressure on the patient** **12**
This paper, first published in *Bedsore Biomechanics* in 1976, outlines that it is possible to design patient-support systems that will prevent the pressure per unit area exceeding the critical value.
JT Scales
-
- The microanatomy of the epidermis in relation to trauma** **16**
This paper, first published in *Bedsore Biomechanics* in 1976, describes the microanatomical features of the epidermis. The functions of the epidermal structures are illustrated by experiments.
CND Cruickshank
-
- Some factors affecting skin and wound healing** **20**
This paper, first published in *Bedsore Biomechanics* in 1976, outlines the effects of environmental factors on skin and wound healing, and discusses indolent wounds.
GD Winter
-
- Biomechanical concepts and effects** **24**
This paper, first published in *Bedsore Biomechanics* in 1976, outlines the mechanics of tissue response to mechanical loads acting on localised areas of skin and subcutaneous tissues.
T Gibson, JC Barbanel, JH Evans
